

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

### **Listing of Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

Claim 1-26: Canceled.

Claim 27 (Currently Amended): A method for operating a welding apparatus, wherein a welding torch or an electrode is fed with controlled or regulated electric power, and wherein, at least during the welding procedure, operating states are detected and transmitted to a computing unit and processed in said computing unit, whereby the detected operating states are processed according to stored specifications and compared with stored state, and wherein messages automatically allocated as a function of the comparative results are transmitted to external receivers in the form of e-mails, via data networks, or in the form of short messages via mobile networks, or in the form of facsimile transmissions via telecommunication networks, or the

messages are converted into acoustic signals to be transmitted to receivers via telecommunication or radio networks;

wherein the messages are transmitted to allocated external receivers as a function of the comparative results; and

wherein the messages are transmitted to said allocated external receivers in an allocated manner as a function of the comparative results.

Claims 28-33: Canceled.

Claim 34 (Previously Presented): A method according to claim 27, wherein the detected operating states are transmitted to the computing unit via a standardized interface.

Claim 35 (Previously Presented): A method according to claim 27, wherein the detected operating states are transmitted to the computing unit in the binary code.

Claim 36 (Previously Presented): A method according to claim 27, wherein the detected operating states are preprocessed prior to being transmitted to the computing unit.

Claim 37 (Previously Presented): A method according to

claim 27, wherein the specifications or states are stored in the computing unit.

Claim 38 (Previously Presented): A method according to claim 27, wherein the specifications or states are stored in a database connected with the computing unit.

Claim 39 (Previously Presented): A method according to claim 27, wherein a unique identification of the welding apparatus is transmitted to the external receiver along with the messages.

Claim 40 (Currently Amended): A welding apparatus including an energy source (2), particularly a power source, preferably controlled or regulated by the aid of a control device (4), and at least one welding torch (10) or an electrode, and further including at least one device for the detection of operating states and at least one computing unit (29) connected with the at least one detection device and provided for the processing of said operating states, and, furthermore, at least one device (35) for the storage of specifications according to which the operating states are processed, and of states with which the processed operating states are compared, and at least one device

(36) for the transmission of messages to external receivers (37), which is connected with the computing unit (29), wherein the transmission device (36) is configured for the automatic transmission to allocated ones of said external receivers (37), of messages allocated as a function of the comparative results, said messages being transmitted in an allocated manner, and wherein the transmission device is comprised of a computing unit including a connection to a data network, or is comprised of a mobile telephone or a facsimile transmitter or an acoustic transmitter unit.

Claims 41-44: (Canceled).

Claim 45 (Previously Presented): A welding apparatus according to claim 40, wherein the detection devices and optionally the control device (4) are connected with the computing unit (29) by a standardized interface.

Claim 46 (Previously Presented): A welding apparatus according to claim 40, wherein the computing unit (19) for the processing of operating states is integrated in the welding apparatus.

Claim 47 (Previously Presented): A welding apparatus according to claim 40, wherein a unit (40) for the preprocessing of the detected operating states prior to their transmission to the computing unit (29) is provided.

Claim 48 (Previously Presented): A welding apparatus according to claim 40, wherein a database (35) connected with the computing unit (29) is provided for the storage of the specifications according to which operating states are processed or of the states with which the operating states to be processed are compared.

Claim 49 (Previously Presented): A welding apparatus according to claim 40, wherein an identification device (39) is provided.

Claim 50 (Previously Presented): A welding apparatus according to claim 40, wherein an external receiver (37) is comprised of a welding apparatus.

Claim 51 (Previously Presented): A welding apparatus according to claim 40, wherein at least one detection device is comprised of a temperature sensor (31).

Claim 52 (Previously Presented): A welding apparatus according to claim 40, wherein at least one detection device is comprised of a camera (33).
